No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

RESULT 1 US-10-081-418-1

Sequence 1, Application US/10081418, Publication No. US20030096745A1 GENERAL INFORMATION:

APPLICANT: HAHM, Kyung-Soo
APPLICANT: LEE, Dong Gun
APPLICANT: LEE, Dong Gun
APPLICANT: PARK, YoonKyung
APPLICANT: KIM, Hee Nam
TITLE OF INVENTION: NO. US20030096745A1el peptides with increased + charge
TITLE OF INVENTION: substituting one or more amino acids of CA-MA peptide
TITLE OF INVENTION: pharmaceutical compositions containing thereof
FILE REFERENCE: 428.1014

and hyd

```
CURRENT APPLICATION NUMBER: US/10/081/418

CURRENT FILING DATE: 2002-02-22

INUMBER OF SEQ ID NOS: 2

SOFTWARE: Kopatentin 1.71

SEQ ID NO 1

LENGTH: 20

TYPE: PRT

ORGANISM: Artificial Sequence
FEATURE:
OFFER INFORMATION: CA-MA peptide made by fusing 1-8 amino acid of secropin A and US-10-081-418-1

US-10-081-418-1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

cc The present invention describes a vehicle-peptide molecule (I) or its cytostatic, antirheumatic, antiaritaritaritic, antidiabetic, ophthalmological, cortostatic, antirheumatic, antidiabetic, ophthalmological, cantianaemic, anorectic, antiinfertility, haemostatic, dermatological, cc antianaemic, anorectic, antiinfertility, haemostatic, dermatological and cc prophylactic agent as well as for screening purposes. (I) is useful for cd diagnosting diseases characterised by dysfunction of their associated cc protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their creating of interest in a biological sample. Additionally, (I) is useful creating of interest in a biological sample additionally, (I) is useful creating of interest in a biological sample. Additionally, (I) is useful cortinated architity, and neurological degenerative diseases, tumour growth, cancer, creatinity, and neurological degenerative diseases. (I), comprising cc ponimetic compounds are useful for treating disorders characterised by compounds are useful for treating conditions that involve an existing cc megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet cc cmegakaryocyte/platelet acid seguences used in the represent amino acid and nucleic acid sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The peptides of the invention are effective pharmaceuticals having anti-microbial, anti-viral and anti-tumour activity. They are also useful for inhibiting, preventing or destroying the motility of sperm and hence have application in a spermicide preparation. They also have anti-parasitic activity and are useful in wound healing, as preservatives and sterilants and to inhibit growth of phytopathogenic microorganisms. AAR20969 and AAR20970 were published in Halghten and Ostresh, Bio Chromatography, Vol 2, issue 2, page 80-83, 1007

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                have increased biological activity and are effective as pharm ceuticals e.g. antibiotics for bacterial, fungal or viral infections, or in spermicides or antinuour or antiparasitic agents. Additionally the peptides can be used in wound healin compans. or for treating burns or other skin or eye infection can also antopological purpose or other skin or eye infection.

The peptide is an analogue of the peptide having SEQ ID NO 3 (AAR22824), with an N-terminal extension of 18 amino acids. Substitution and deletion analogues of this peptide have increased biological activity and are effective as pharmaceuticals e.g. antibiotics for bacterial, fingal or viral infections, or in spermicides or antitumour or antiparasitic agents. Additionally the peptides can be used in wound healing compsns. or for treating burns or other skin or eye infections. See also AAR22822-89.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antiparasitic;

They are also useful for inhibiting, preventing or destroying the motility of sperm and hence have application in a spermicide preparation. They also have anti-parasitic activity and are useful in wound healing, as preservatives and sterilants and to inhibit growth of phytopathogenic microorganisms. AAR20969 and AAR20970 were publish that property and account of the phytopathogenic microorganisms. AAR20969 and AAR20970 were published that the property of the phytopathogenic microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Method for inhibiting target cell and virus growth - comprises administering amphiphilic peptide compsns, useful for treating viral and phytopathogenic infections, tumours and burns
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amphiphilic peptide; anti-microbial; anti-viral; anti-tumour; spermicide; wound healing; sterilant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         acetylated N-terminus, may be a C-terminal amide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       solid phase methods. The peptide is an analogue of the peptide having SEQ ID NO 3 (AAR22824), with an N-terminal extension of 8 amino acids. Substitution and deletion analogues of this peptide have increased biological activity and are effective as pharmaceuticals e.g. antibiotics for bacterial, fungal or viral infections, or in spermicides or antitumour or antiparasitic agents. Additionally the peptides can be used in wound healing compans. or for treating burns or other skin or eye infections.

The present invention describes a method for producing micelles with entrapped therapeutic agents. The method comprises: (1) combining negatively charged agent with a cationic lipid in a ratio where 30-90 % of the negatively charged atoms are neutralised by positive charges on lipid molecules to form an electrostatic micelle complex in 20-80 % ethanol; and (2) combining the micelle complex of (a) with fusogenic-karyophilic peptide conjugates in a 0.0-0.3 ratio, therefore producing micelles with entrapped therapeutic agents. Also described is a method for delivering a therapeutic agent in vivo, comprising the administration of the micelle. ABB74256 to ABB74858 represent specifically claimed nuclear localisation signal (NLS) peptides for use in the method as the fusogenic-karyophilic peptides. The micelles produced can have cytostatic and antitumour activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Encapsulation of plasmid DNA (Lipogenes) and therapeutic agents with nuclear localization signal/fusogenic peptide conjugates into targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2002-164295/21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Septic shock is often due to the body's reaction to foreign lipopolysaccharide (LPS). The compounds of the invention neutralise bacterial endotoxins without neutralising essential proteins in the plasma of patients, eg.heparins. They also have longer duration of activity than unconjugated peptides. In general peptides such as this are ion-channel forming peptides. The compounds are biologically active peptides ilnked to a conjugate moiety, eg. carbohydrates, proteins, polyvinylpyrrolidone, polyalkylene glycols and polyvinyl alcohols. The conjugate moiety may be linked at the C- or N-terminal or internally of the peptide. AARS5591-631 and AARS56879-957 are examples
                                                                                                                                                                                                                                                                                                                                                                                                                                Example; Page 38; 107pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09-JUN-2000; 2000US-210925P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                08-JUN-2001; 2001WO-US18657.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fusogenic; nuclear localisation signal; NLS; encapsulation; lipogene; liposome; micelle; karyophilic; cytostatic; antitumour; solid tumour; peptide-lipid-polynucleotide complex; neoplastic disease; gene therap breast carcinoma; prostate carcinoma.

The invention relates to the field of gene therapy and is directed toward methods for producing peptide-lipid-polynucleotide complexes suitable for delivery of polynucleotides. The encapsulated molecules display therapeutic efficacy in eradicating solid tumours including but not limited to breast carcinoma or prostate carcinoma. ABB74235 to ABB74255 are used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention.
                                                                                                                                               The present peptide is a specific example of a cationic oligopeptide corresp. to the formula (b-l-1-b)n, where b is a hydrophobic amino acid, lis a hydrophilic amino acid and n is at least 4. In this case, where b is Leu, l is Lys and n = 10, the oligopeptide forms an alpha-helix which forms a stable complex with a nucleic acid. The complex is suitable for transferring nucleic acid, esp. in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                            Complex of nucleic acid and oligopeptide with sec. structure transfer vectors contg. them, useful for efficient transfer of nucleic acid to cells in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bazile D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-FEB-1994;

                                                                                   The invention relates to analogues of a magainin I or II, D-form analogues, deletion analogues or related peptides. It also relates to basic polypeptides having at least 16 amino acids, including at 18 hydrophobic amino acids and at least 8 hydrophilic amino acids. The peptides may be used as antimicrobial agents, antiviral agents, antiviral agents, preservatives or sterilants, or agents for promoting wound healing. present sequence represents a specific example of a peptide disclose the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW66517;

                                                                                                                                                                                                                                                                                                                                                                                                                                               The peptides of the invention are effective pharmaceuticals having anti-microbial, anti-viral and anti-tumour activity. They are also useful for inhibiting, preventing or destroying the motility of sperm and hence have application in a spermicide preparation. They also have anti-parasitic activity and are useful in wound healing, as preservatives and sterilants and to inhibit growth of phytopathogenic microorganisms. The peptide is an analogue of the peptide having SEQ ID NO 3 (AAR22824), with Leu at position 4 deleted. Substitution and deletion analogues of this peptide have increased biological activity and are effective as pharmaceuticals e.g. antibiotics for bacterial, fungal or viral infections, or in spermicides or antitumour or antiparasitic agents. Additionally the peptides can be used in wound healing compsns. or for treating burns or other skin or eye infections.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score
